One of the most dangerous STDs is HIV infection. Unfortunately, many people with HIV infection develop full blown AIDS. It is estimated that there are approximately one million individuals in the United States with AIDS at the present time. However, this is a conservative estimate and approximately 500,000 people with AIDS are believed to have died from AIDS. The human immunodeficiency virus (HIV) is the cause of acquired immunodeficiency syndrome (AIDS) (AIDS is also commonly referred to as "AIDS disease"). The first case of AIDS was identified in 1981. The number of individuals infected with HIV has risen to over 6 million. AIDS is spread by direct contact with blood, semen, vaginal fluid, rectal fluid, or other body fluids from an infected person. The HIV virus is spread mainly through sexual contact, contaminated blood, and blood transfusions. Although anti-HIV drugs have been developed, these drugs do not cure individuals with AIDS. There is still a need in the art to develop new drugs and therapeutic compounds to treat and/or prevent HIV infection. When the news broke that the New York Giants had brought back Chris Shelton after a surprising two-year break from the game, many fans and media members didn't bat an eye. He wasn't seen as a game-changer. In fact, after making the team out of camp, his first-half performance on the field had fans and the media asking if he should even be the guy to start in 2018. Yet, in the six games that Shelton played with the Giants, he made an immediate impact on the team. He looked like the player who took off after his rookie year, and the Giants might have to give him a starting job in 2018. Shelton took a step forward as a pass-catcher. He had a strong first game with the Giants, picking up five catches for 59 yards in a 20-17 win against 4bc0debe42
