Category:SteelBRANDON, Fla. -- There were reports that you could see a cloud of dust from the Tesla Model S Roadster as it crossed the finish line on the stage of the Rolex Monterey Motorsports Reunion at the weekend. The report -- which is flatly denied by Tesla -- seems to have been true, according to an eyewitness account of the car's crossing of the finish line. The posting on the popular car-focused forum reddit.com said, "The car is truly staggering, if not a bit awe-inspiring. But that is not what was really amazing. Once I got close enough, the car was traveling something like 60mph but mostly just blowing hair off the people and covering the stage in dust, but it never slowed down. Even when I got right next to the car, it was not even coming to a stop. The next thing I knew, it was gone. I managed to

get a few good photos of the car and just happened to have a car with me that was already a bit dirty (because of that dust cloud) which ended up being about 10-15 seconds later, and the car was still moving. I do think it slowed down a bit once it started going downhill, but I could not really see because of the dust cloud. A friend of mine took a video of the car just before he had to get out of the way to avoid a collision, and I did not see any car moving when I first saw it." The report states that the car was traveling "something like 60mph but mostly just blowing hair off the people and covering the stage in dust" before it sped away. Despite the fact that some people claim to have seen the car on-site, the real-time results have the car finishing 26th and nearly 12 laps down. The real-time results

for the race are below: The present invention relates to a method and apparatus for drying a wafer of semiconductor or similar substrate for electronic circuits. More particularly, it relates to improvements in the art of drying wafers with high yields, by means of a system which is continuously operated and which is suited for maintaining a uniform film of water at the surface of a wafer. The invention is particularly suited for use in the production of electronic devices and semi-conductor wafers having electronic circuits thereon, e.g., memory chips, microprocessors, etc. In the process of manufacture of semi
