Other networks, such as VSO and ASSIST, use a similar track of activity. The F-16 was a single-seat, twinjet, multirole, fighter aircraft developed by the United States Air Force. The first F-16s entered service in 1977, and were used by most countries of the world during the early 1980s. F-16 production ended in 1992, and by 1998 over 3,000 F-16s had been built. The total production runs to about 2,500 aircraft before being replaced by the F-22 Raptor, which entered service in 2004. Although the F-16 design has been widely copied by many other nations, it remained popular with foreign air forces due to its strong maneuverability, flexibility, and commonality with existing aircraft. Production of the F-16 was assigned to several American defense contractors, including Rockwell International, General Dynamics, Lockheed Martin, and McDonnell Douglas. The F-16 was also produced by Canadian and Japanese air forces. After being reentered in May 2017, the F-16 Fighting Falcon is the world's best-selling single-engine fighter. It was also the fastest, the best-maneuvering, the best-armed, and the best-crewed fighter of its generation, as well as the most successful U.S. fighter in the 1970s and 1980s. During its service life, the F-16 has been equipped with a variety of avionics and sensors, including the AN/APG-63 Fire Control Radar (FCR), AN/APG-68 Active Electronically Scanned Array (AESA) radar, the AN/ALE-47 Advanced Integrated Defensive Electronic Warfare Suite (AIDEWS), and the AN/ASQ-31 Electro-Optical/Infrared sensor. Beginning with the F-16A Fighting Falcon in the early 1970s, the two-seat F-16B/C, also known as the F-16D/F, has been upgraded with a three-view AN/ALE-47 electronic warfare suite, improved avionics, and more powerful engines and a strengthened airframe. The first F-16A produced by Northrop Grumman in 1975, was used for test and evaluation (T&E) before entering service. F-16As (and the F-16B/C) have been used in combat by the Israel 4bc0debe42
